

# Fast Fashion

## vs.

# Eco-Friendly Fashion

### The Impact of Fast Fashion

- **Synthetic materials:** Many clothes use polyester or nylon, which come from fossil fuels and can release tiny plastic fibres.

- **Textile waste:** People throw away millions of clothes, and many items end up in landfill.

- **Carbon footprint:** Making and transporting clothes uses energy and creates greenhouse gases.

### Sustainable Alternatives

- **Thrifting:** Buy good-quality second-hand clothes and give them a new life.

- **Capsule wardrobes:** Choose a small group of clothes that work well together.

- **Ethical brands:** Support companies that pay workers fairly and use safer materials.

### Discussion Starters

- If clothing was more expensive, would you buy fewer items?
- If you could only wear ten outfits for a month, what would you choose?
- If every brand used recycled materials, would fashion be better for the planet?
- If you knew a brand treated workers unfairly, would you stop buying from it?
